Submission Instructions

Data Structures and Algorithms, Imperial College Business School

Instructor: Prof. Reza Skandari, r.skandari@imperial.ac.uk

This describes how to submit your work for this module. It applies to every class activity and homework.

1. Overview

You submit by **uploading a zip file to Canvas**.

- After each class, zip up that class's activity folder and upload it to the corresponding assignment on Canvas. This applies every week, classes 1 through 10, even on weeks where the activity isn't graded; we still want a record of your work.
- You also submit each homework the same way.
- Name the zip to match what you're submitting, for example `class-3-activity.zip` or `hw-01-activity.zip`.

We assess your **final submission** for each class or homework, not any interim version you may have uploaded earlier. Feel free to re-upload if you improve on your work before the deadline; only the last one counts.

2. Step by step

1. **Test your work first.** Open a terminal in the folder you're about to submit and run:

   ```
   python ok --score
   ```

   Check the point breakdown looks right: this is exactly what determines your grade, and it's much better to catch a problem now than after submitting.

2. **Zip the activity folder itself.** Right-click the folder (e.g. `class-1/activity/`, or `hw-01/`) and choose the compress option: **"Compress to ZIP file"** on Windows, **"Compress"**

on macOS. This creates a zip with the folder inside it. Rename the resulting zip to match the naming pattern above, e.g. `class-1-activity.zip`.

3. **Double-check the result.** Open the zip file you just created (double-click it, or use "Extract All"/expand) and confirm you see one folder inside it, and that opening that folder shows `ok`, `tests/`, and your `.py` / `.ipynb` files.

4. **Upload to Canvas**, to the assignment matching that class or homework.

3. A note on what "working" means

Your zip should be your activity folder exactly as you left it, including `tests/`, the `ok` launcher, `reset_ok.py`, and any `.tests_backup/` folder. Don't delete or rename anything; we run `python ok --score` on exactly what you submit, so it needs to run there the same way it ran on your machine. If `python ok --score` didn't produce a sensible score for you locally (step 1 above), it won't for us either, so that's the moment to ask for help, not after submitting.

If you're ever unsure whether your zip is structured correctly, ask a TA or Reza before the deadline: it's a five-second check for us, and much easier to fix in advance than after the fact.
